

Hydro Chute Waste Streamer

UK Manufactured & Installed Only By Hydrochute

The Hydro Chute Waste Streamer was designed to dramatically reduce or eliminate the historical issues of durability and reliability surrounding waste separation in tall buildings.

A patent-protected in-house design is available in either a 2 way or a 3-way waste stream selection system. The Hydro Chute Waste Streamer allows residents to select the waste stream they require thus facilitating the ability to recycle on-site.

By selecting the appropriate waste stream button at the refuse chute hopper, the automated deflector plate will move, ensuring the waste exits the correct discharge into the appropriate bin.

Once the deflector is in place, a green light will indicate the hopper is now unlocked and refuse can be deposited within.

Patent No GB2626675

A red light will indicate if the chute is already in use on another floor or if the bins are being emptied. The hopper will remain locked whilst either of these situations is ongoing.

The Hydro Chute Waste Streamer has been designed and manufactured robustly to withstand impact from 50+ stories and has been thoroughly tested.

The Hydro Chute Waste Streamer is compatible with other recycling chute brands. It can be retrofitted allowing for an upgrade without replacing the entire existing recycling chute system.
